

## PROSTATE CANCER FACTS:

- Prostate cancer is the second leading cause of cancer death in men.
- One in six men will be diagnosed with prostate cancer during his lifetime compared to one out of seven women developing breast cancer.
- According to the American Cancer Society, prostate cancer is the most frequently diagnosed cancer in men aside from skin cancer.

## CURRENT STANDARD FOR DIAGNOSIS

Current standard for diagnosis

- PSA (prostate specific antigen) blood test
- DRE (digital rectal exam)
- TRUS (transrectal ultrasound guided) biopsy (if DRE finding or PSA level is abnormal).
- Repeating PSA test or biopsy (if biopsy is negative)

## A NEW OPTION

AdventHealth Wesley Chapel offers MR/Ultrasound guided biopsy with UroNav.

MR/Ultrasound guided biopsies are a new option for patients with negative TRUS biopsy, with continued elevated or rising PSA or positive DRE.

## BENEFITS OF MR/US FUSION-GUIDED PROSTATE BIOPSY

Prostate MR images taken can potentially identify specific areas within the gland that are suspicious and require further evaluation.

Performing biopsy with MR/US fusion holds the potential to target the suspicious areas, reduces the number of tissue samples acquired, and thus may reduce risk of false negatives, infection, bleeding, pain and recovery time.

## MR/US FUSION: A NEW STANDARD

MR/Ultrasound guided biopsy is the new standard in prostate care. This technique fuses pre-biopsy images of the prostate with ultrasound guided biopsy images in real time for excellent delineation of the prostate and suspicious lesions.

## WHO IS A CANDIDATE FOR PROSTATE MRI?

- Patients with negative prior transrectal ultrasound guided (TRUS) biopsy and continued elevated prostate specific antigen (PSA) level
- Patients with positive digital rectal examination (DRE) and a negative transrectal ultrasound guided TRUS biopsy
- Patients requiring prostate surgery or radiation therapy

## WHAT TO EXPECT FROM PROSTATE MRI?

Diagnostic MRI Imaging Process: Prostate MRI is a noninvasive imaging technique that does not utilize exposure to ionizing radiation.

- When receiving an MRI, patients are positioned on a examination table integrated with MRI system.
- When the examination is completed, patients may be asked to wait until the images are processed in the event additional scans are required.
- MRI exams generally include multiple scans (sequences), some of which may last several minutes.  
The entire exam is usually completed in 45 minutes.
