Advent Health

Learn about early detection for breast cancer.

At AdventHealth for Women, we're dedicated to helping women protect themselves against breast cancer. Breast cancer is the second deadliest cancer among women in the country, and the second most common. But, with early detection and effective treatment, breast cancer has an extraordinarily high long-term survival rate.

A mammogram is the most effective way to detect breast cancer at the earliest possible stage, before it can spread to other parts of the body. While self-examination is not a substitute for a mammogram, the American Cancer Society also recommends that women become familiar, through self-examination, with how their breasts normally look and feel, so they can talk to their doctors about any changes.

Make this simple screening a priority.

A mammogram is a non-invasive screening that is essentially an X-ray examination of the breast. There are two types of mammograms. The first type, known as a screening mammogram, is a preventive screening for women who have not experienced any abnormal breast symptoms. Screening mammograms are recommended at least every two years, starting between the ages of 40 and 50. You and your physician can determine when and how often you should have a screening mammogram based on your history and risk factors.

The second type, a diagnostic mammogram, is for women who display symptoms that need to be investigated, such as a breast lump or nipple discharge. It may also be performed as a follow-up to a screening mammogram that indicates a need to more closely investigate a particular area of the breast.

Digital Mammography

At AdventHealth for Women and AdventHealth Imaging, we use the most advanced tools in digital mammography and computer-aided detection, which allows our imaging specialists to detect subtle differences between tissues, pinpointing areas of concern, like cancerous tissue, benign tumors and cysts, well before they can be detected by touch. Plus, we use the breast conforming “smart paddle” design, which provides a more comfortable overall experience.

Our radiologists then use computer-aided detection tools to read the digital images, looking for any signs of abnormality, including asymmetries, irregular areas of increased density and clusters of small calcium deposits. The development of these tools has enabled substantially improved breast imaging, especially for women with dense breast tissue. Digital mammography provides electronic images of the breasts that can be enhanced by computer technology, stored on computers, and even sent electronically when remote access to the mammogram is needed.

Self-referred Mammogram

AdventHealth and AdventHealth Imaging offer self-referred screening mammograms for women age 40 and older who have not had a mammogram in the last year and who have no breast symptoms.* In this case, women refer themselves without a physician’s prescription and the results are sent directly to the patient as opposed to the patient’s physician. However, it’s best to talk to your physician to determine when you should start having mammograms, even if you plan on self-referring.

*A prescription is required for screening mammograms at AdventHealth Waterman.

Get the truth about mammograms.

From their cost, to their efficacy, to how uncomfortable or lengthy they are, mammograms are shrouded in mystery and misunderstanding. Here are the facts about mammograms.

MYTH 1: A MAMMOGRAM TAKES TOO LONG.

Fact: Exams usually take less time with digital mammography. Patients typically complete a screening mammogram appointment in less than 30 minutes. Plus, many of our locations offer weekend, lunchtime and evening appointments, as well as walk-in availability.

MYTH 2: MAMMOGRAMS COST TOO MUCH.

Fact: Most insurance companies cover the full cost of a screening mammogram as it may be considered preventive care. Also, low-cost or fully funded mammograms are offered through national programs, community organizations and the AdventHealth Breast Cancer Care Fund.

MYTH 3: MAMMOGRAMS ARE PAINFUL.

Fact: Mammograms may be uncomfortable, but should not be painful. The level of discomfort you experience should be much less than in years past due to the new compression paddle design that flexes with your body, providing pressure only where needed.

MYTH 4: RADIATION FROM MAMMOGRAMS CAN CAUSE CANCER.

Fact: Mammograms are very safe. Digital mammography uses the lowest radiation dose required to produce clear and precise images. One would receive about the same amount of radiation on a cross-country flight.

Breast health starts with your health.

Prioritizing your well-being in body, mind and spirit is a great way to keep yourself healthy.

FOCUS ON YOU

Learn to care for yourself the way you care for others.

EAT HEALTHY

Follow a balanced diet containing the main food groups (fruits, vegetables, grains, dairy and protein). Eat whole grain food such as whole wheat flour, oatmeal and brown rice. Take a daily multivitamin while limiting alcohol intake and saturated or trans fat intake.

EXERCISE

Begin an exercise program and be active at least three times per week.

FIND BALANCE

Examine the stresses in your life and find ways to reduce them, if possible. Meditating daily, exercising regularly and participating in yoga can help reduce stress.

KNOW YOUR NUMBERS

The annual physical provides an opportunity for your doctor to establish baseline information he/she can use for comparison purposes in future physical exams. Because even small changes can indicate potentially serious problems, an annual physical can detect an illness before it begins or during early stages of development.

PAY ATTENTION

Perform monthly breast self-exams and contact your physician immediately if you feel anything abnormal.

STAY CONNECTED

Tap into a support network to stay healthy, such as your friends, family, spouse/partner, spiritual community, online discussion groups and/or others.

What to Expect from Your Mammogram

Before Your Exam

If there is any possibility you are pregnant, inform your doctor or the technologist conducting your mammogram before your exam. Refrain from wearing deodorant, talcum powder or lotion under your arms or on your breasts on the day of your exam.

What to Expect

Your breast will be briefly compressed between two plates attached to the mammogram machine. The bottom plate holds the digital detector that records the image.

Once in the exam room, your technologist will position your breast in the mammogram machine.

You will fill out a breast history form to be discussed with the technologist prior to the exam.

The exam may be uncomfortable for a few seconds, but should not be painful. A simple repositioning may help, so make sure to notify your technologist of any discomfort.

A technologist will escort you to the dressing room and ask you to undress from the waist up and put on a gown.

We design your care to fit your life.

We are committed to your care while minimizing disruption to your life. That's why we offer the expertise of our nationally recognized, sub-specialist radiologists 24 hours a day, seven days a week at 14 AdventHealth and AdventHealth Imaging freestanding facility locations.

Accredited by the American College of Radiology

All of our imaging centers are accredited by the American College of Radiology (ACR) for imaging excellence. Rest assured that your prescribed imaging test will be done at a facility that has met the highest level of imaging quality and radiation safety. Our facilities and personnel have gone through a comprehensive review to earn accreditation status by the ACR.

Take charge of your care.
